

4 JENNIFER VIERECK: Hello, everyone. My name
5 is Jennifer Viereck. I'm the director of HOME,
6 Healing Ourselves and Mother Earth, at the California
7 office, which is in Tecopa, directly downstream from
8 Yucca Mountain.

1
9 [When you start the nuclear fission process,
10 whether in a reactor or in a bomb, you initiate a
11 powerful destabilizing and destructive process which
12 cannot ever be stopped again. It takes up to 250,000
13 years run to its course creating 80 different highly
14 toxic byproducts. They will take a million years to
15 complete their own decay process. That's what we
16 know so far.

17 Before you can operate a reactor, an
18 enormous amount of fossil fuel is used in refining
19 and concentrating uranium ore. Even more is used to
20 produce the cement, steel and machinery in the
21 17 years it takes to build a nuclear reactor. To
22 solve the global warming problem in that way, a new
23 reactor would have to go on line every week for the
24 next 20 years, and that is not going to happen.

25 Conservation alone could eliminate the 20
1 percent of electricity we now use from nuclear
2 reactors. In nuclear reactors we do all this to boil
3 water to make steam to turn turbines. There are
4 other ways to do that which do not leave us with a
5 multibillion dollar burden of the most toxic
6 substance we know for the next million years.

7 Accidents happen. Serious nuclear accidents
8 took place in Japan this year. Chernobyl
9 contamination is still causing problems in northern
10 Europe long after it was predicted. No matter how
11 carefully this process is planned and executed,
12 accidents happen.

13 Look at our display in the back of the room
14 to see nuclear fuel rods all over the Massachusetts
15 turnpike in 1991. At the WIPP repository for weapons
16 waste in New Mexico, last year alone six trucks came
17 in contaminated from the place of origin affecting
18 everyone along the route. As of Wednesday, WIPP is
19 facing a million dollars in fines for mismanagement
20 in other areas.

21 Who really pays these fines on top of all
22 the other costs and the health costs for contaminated
23 nuclear workers? We do, the U.S. taxpayers. Do we
24 need a deep geologic repository for the irradiated
25 fuel we already have? Yes, we do. In the long run a
1 deep geologic repository is the safest method we know
2 so far, but Yucca Mountain was disqualified years ago
3 from being a deep geological repository as defined in
4 the Nuclear Waste Policy act. As proposed now, 90
5 percent of the barriers that contain the waste would
6 be man-made. This system could be built almost
7 anywhere, including under Washington.

8 Is there a safer alternative for storing
9 irradiated nuclear fuel now? Absolutely. And
10 scientists around the world have been saying so loud

11 and clear. In the first 50 to 100 years an enormous
12 portion of the radioactive decay will have taken
13 place, leaving mainly plutonium that is deadly and
14 long lasting, but it's a small percent overall.

15 Storing this material as near to the site of
16 origin as reasonably possible in harden on-site
17 storage facilities for the next 50 years or more
18 would make transportation much, much safer
19 nationwide. It would also allow time for additional
20 research on a true and safe deep geologic repository.

21 The idea that rushing to consolidate
22 irradiated fuel in one place will make the public
23 safer is a falsehood. Any reactor that continues to
24 operate will generate more irradiated fuel every
25 three months and store it on site anyway. Yucca
1 Mountain would just be a new place. And the entire
2 freeway and rail systems of the U.S., including many
3 major cities, would be routinely exposed to hotter
4 radiation from the transport vehicles even if
5 accidents were not to occur.

6 I have reviewed these documents to the
7 extent that I can on a laptop. We will be submitting
8 extensive written comments by the deadline. I can
9 see that a lot of careful thought, research and
10 design has gone into every aspect of both the
11 handling facilities and cask and the transportation
12 planning.

13 All the questions I asked in Amargosa Valley

14 about containment systems and drainage concerns were
15 answered clearly. However, I finally realized that
16 my discomfort came from the feeling that this is like
17 spending a lot of time discussing frosting recipes to
18 put frosting on a hog. It's still a hog when you're
19 done. Whether we put the parking lot full of fuel
20 too hot to go in the repository to the left or the
21 right of the latest fault line, we're still placing
22 that pad in the third most active earthquake zone in
23 the United States.

24 All the careful planning that's gone into
25 the TAD canister system is irrelevant to many of the
1 reactor sites since they're not compatible with
2 existing systems. They are also purely hypothetical,
3 exist only on the drawing board and have never been
4 tested.

5 Whether the rail line costs 2 million or 3
6 or 10 or 12 down the road will not help the many
7 sites that have no rail spurs and never will.
8 Extensive planning for heavy haul trucks also does
9 not seem to have a lot of practical application.

10 The overall project continues to rely on
11 other falsehoods of great concern, that the federal
12 government has a legal right to withdrawal of Western
13 Shoshone treaty lands which were ratified by the U.S.
14 Congress long ago, that the state of Nevada can be
15 litigated into providing the water rights, that
16 highly fractured welded tuff is anything like
17 granite, that the Amargosa River watershed is

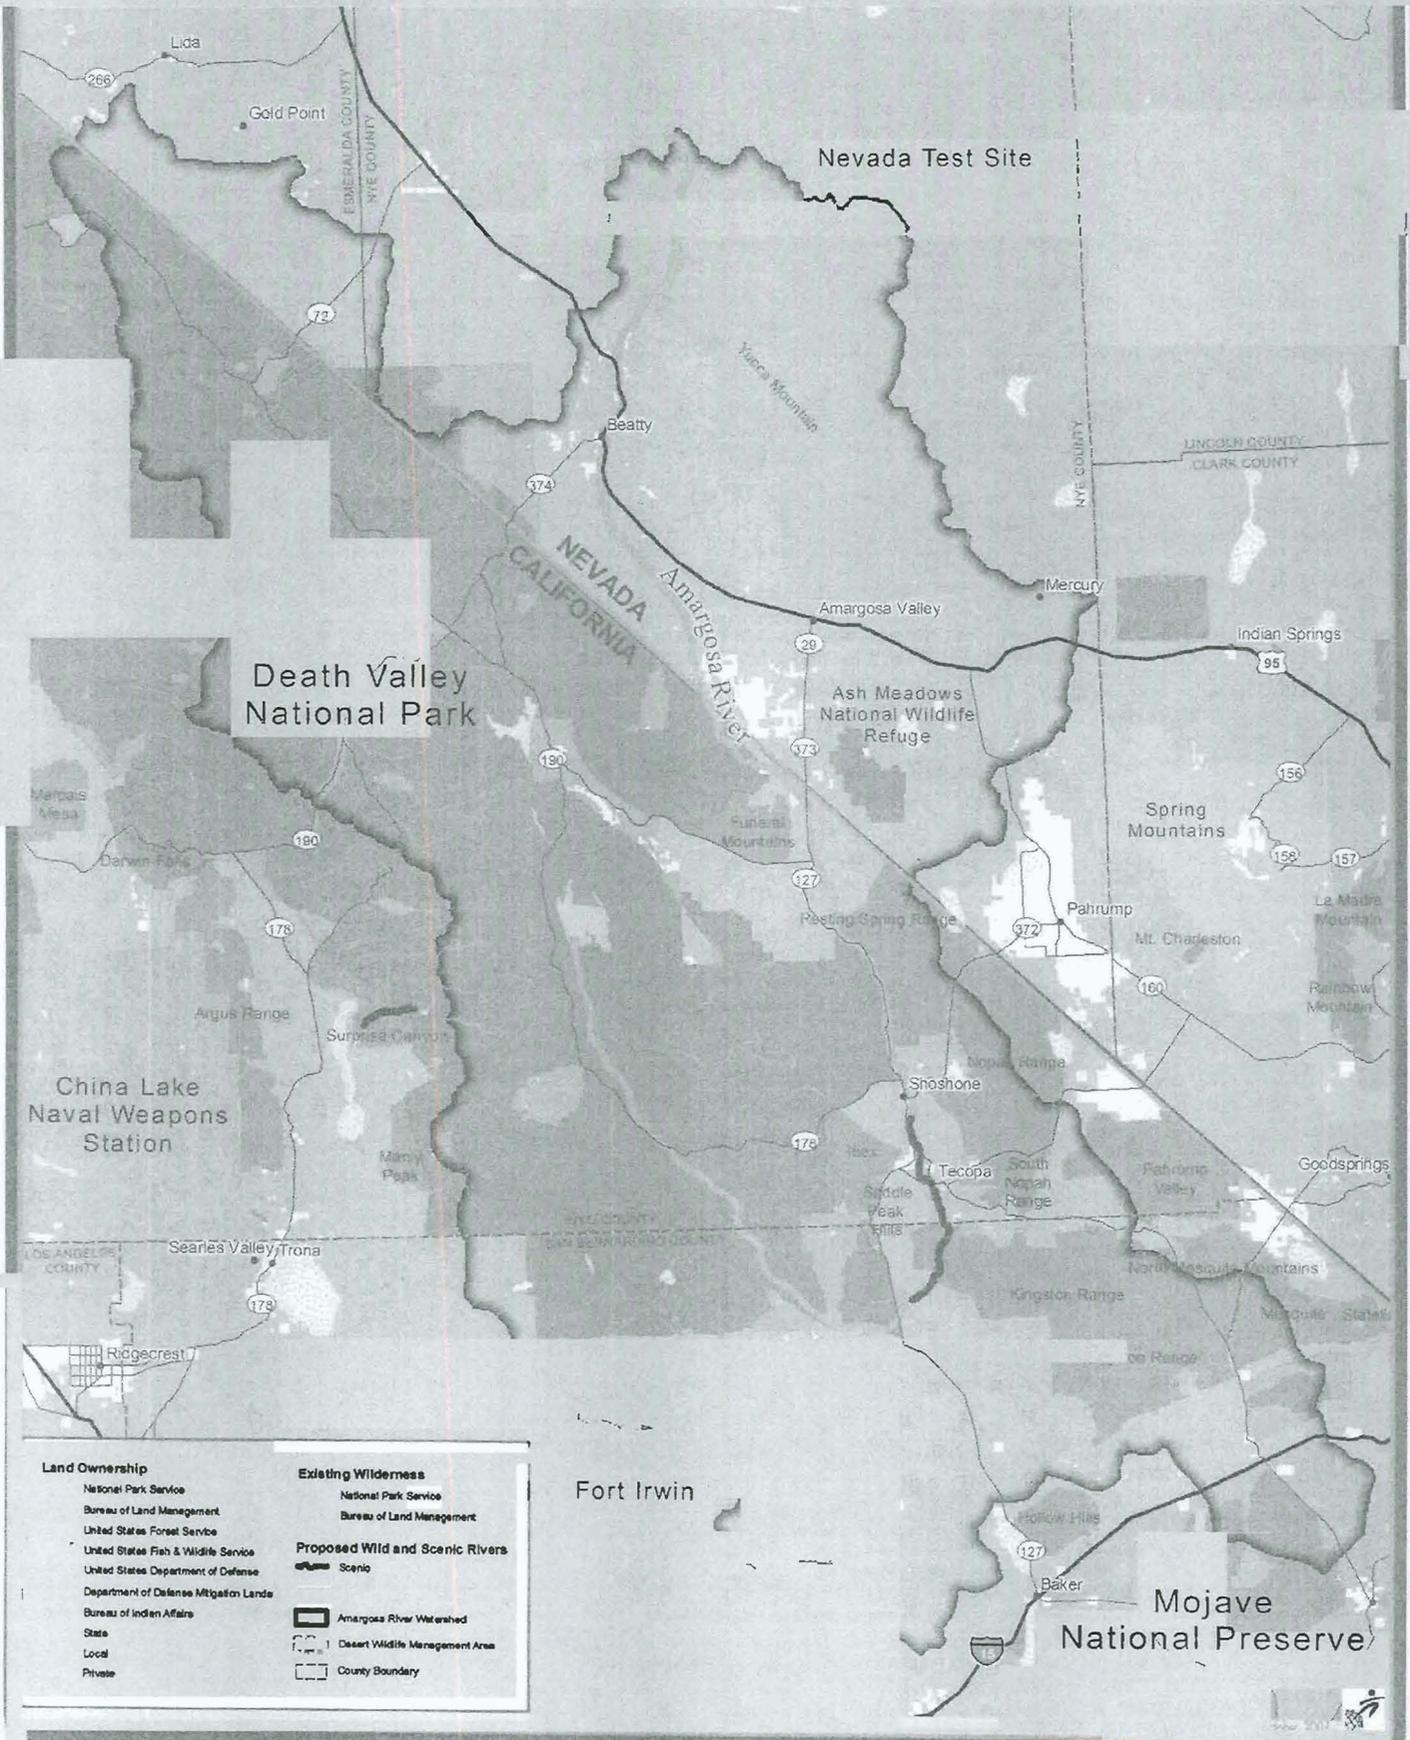

18 unimportant or even nonexistent, that the entire
19 region of southeast Inyo County can be written off as
20 a sacrifice zone designated as the nation's nuclear
21 trash can just because it's part of the basin and
22 range closed drainage system.]

2

23 [In closing, I would really like to thank the
24 DOE for holding this meeting in Lone Pine, for
25 recognizing the impacts of this project on
1 Californians, and Inyo County in particular. I would
2 also like to present the DOE with a map I promised on
3 Monday illustrating the Amargosa River watershed and
4 Yucca Mountain flow near its apex. I hope that this
5 helps you get the river back on your own maps as
6 well.] Thank you all for your time and attention.
